

ABSTRACT

A method for the processing and displaying of test results is provided by first obtaining the test and the responses given by the test-takers. Next, a determination is made of the appropriate skill categories necessary for a correct response for each of the items on the test so as to report each of the test taker's skill specific performance on the test. Then, the test is assessed to determine to what extent each item on the test assesses one or more of the skill determined above. A score is calculated for each student's performance in each of the skill categories.
